Abstract. As the effects of climate change become more severe, environmental sustainability has become an urgent problem in public administration. The purpose of this research is to examine the approaches taken by governmental agencies to lessen their carbon footprints and boost renewable energy sources. The methodology incorporates a survey of relevant literature, an examination of relevant policies and laws, and a comparison of various national approaches. The findings demonstrate that carbon pricing and emissions trading systems are useful instruments for encouraging reductions in emissions, though their applicability may be constrained in some settings. Investment and deployment of renewable energy technologies can be prompted by goals for increased use of such sources, as well as by financial incentives and regulatory support. Investment in distributed renewable energy systems is encouraged by feed-in tariffs and net metering, but these policies may have unintended effects. There is a great deal of diversity in the policies and strategies employed by various nations, but there are also many similarities and shared experiences that can be used to create more effective policies. The research highlights the importance of public management in developing and implementing policies and strategies to combat climate change. The results are instructive for academics, policymakers, and practitioners in their pursuit of better methods of lowering carbon emissions and advancing sustainable energy.

Keywords: Reducing, Greenhouse, Gas Emissions, Renewable Energy

INTRODUCTION

Han & Ahn (2020) argue that climate change is one of the most pressing issues of our time because of the damage it can do to ecosystems and human civilization. As the use of fossil fuels has increased, so too has the release of greenhouse gases into the atmosphere, raising world temperatures to heights not seen in millions of years. (Latif et al., 2021). As a result, natural catastrophes like glacial melting and rising sea levels are becoming more common and destructive. In order to solve this problem, it is crucial to increase the use of sustainable energy sources and decrease emissions of greenhouse gases. (Massar et al., 2021). Barata-Salgueiro and Guimares (2020) note that public administration plays a pivotal part in advancing sustainable practices and policies that lead to these outcomes.

The emphasis of this thesis is on the function of public administration in promoting renewable energy and reducing greenhouse gas emissions. (Eitan, 2021). This research aims to find best practices and policies that public organizations can implement to increase sustainability and lessen their environmental impact. (Obuobi-Donkor et al., 2022). The opportunities and threats facing public administration in supporting sustainable practices and policies are another focus of this thesis. (Peimani & Kamalipour, 2021).
The research will utilize a literature analysis and country case studies to determine effective methods for decreasing GHG emissions and increasing renewable energy use. (Avtar et al., 2019). Policymakers, public administrators, researchers, and practitioners in the area of environmental sustainability will all benefit from this study's findings. (Stoica et al., 2020). This research aspires to aid in the fight against climate change and the advancement of a more sustainable future by finding effective strategies for promoting sustainability through public administration.

METHODS

In this qualitative study, we investigate how public management can be used to lessen emissions of greenhouse gases and increase use of renewable energy sources. Effective policies and practices for promoting sustainability are identified through a methodology that includes a review of pertinent literature as well as case studies from various countries. In compiling its findings, the literature review looked to authoritative sources like scholarly journals, official reports, and foreign groups. Changes in the environment, emissions of greenhouse gases, alternative energy sources, and government management are all examined in detail. The goal of the literature review is to lay the groundwork for the research by highlighting the most important ideas and topics that have been discussed previously.

This research will use case studies from a variety of nations to analyze the effects of sustainability-focused policies, programs, and regulations. Case studies were chosen based on their fit with the study questions, diversity in terms of location and political setting, and data availability. Document analysis and semi-structured interviews with important informants will be used to deconstruct the case studies. Carbon taxes, renewable energy targets, and green procurement policies will all be front-and-center in the document analysis that aims to support sustainability. The study will look at the benefits and drawbacks of these policies for public administration, specifically how well they work to curb emissions of greenhouse gases and advance the use of renewable energy sources.

Key informants will include public managers, policymakers, and specialists in environmental sustainability, and the interviews will be semi-structured. The goal of the interviews is to gather perspective on the opportunities and obstacles faced by public administration in the pursuit of sustainable practices and policies. The conversations will be recorded and transcribed so that the data can be analyzed later. Content analysis and thematic analysis will be used to examine the information gathered from the literature survey and the case studies. Policies, programs, and laws that have been enacted to promote sustainability will be analyzed using content analysis, and common themes and patterns across the case studies and interviews will be identified using thematic analysis.

Overall, this study's methodology aspires to supply a rigorous and systematic strategy to investigating public administration strategies for cutting down on greenhouse gas emissions and boosting renewable energy. This research combines a literature analysis with case studies and interviews to explore the role of public administration in fostering sustainability from multiple perspectives.

RESULTS AND DISCUSSION

Researchers discovered that many nations are taking steps to curb their use of fossil fuels and boost renewable energy sources. Carbon pricing, emissions trading, and renewable energy goals are all part of the regulatory framework aimed at lowering global warming pollution. Feed-in tariffs, green funding, and subsidies for electric vehicles are all methods used to spread awareness about the benefits of renewable energy. The research also discovered the importance of public management in advancing sustainable practices and policies. To lessen their impact on the environment and to advance the use of renewable energy sources, public agencies are adopting "green procurement policies," "net-zero building standards," and "community energy projects."
Evidence from Canada, Germany, China, and Brazil shows how various nations are tackling the issue of sustainability. While Germany places a premium on energy efficiency and community energy projects, Canada has adopted a Clean Fuel Standard and is a member of the Clean Energy Ministerial. Brazil has a comprehensive National Climate Change Policy with a strong emphasis on biofuels and hydroelectric power, while China has enacted a National Action Plan on Climate Change and is investing heavily in solar and wind energy.

**Analysis of policies and regulations for reducing greenhouse gas emissions:**

The research compared the effectiveness of different national policies and laws in lowering GHG output. Emissions can be reduced through carbon pricing, but the strategy faces obstacles like political opposition and low prices. However, chances to increase its effectiveness may arise through the combination of carbon pricing with other policies and the recycling of revenue. Due to its low prices and limited reach, emissions trading was only found to be moderately successful. However, chances to increase its effectiveness may arise from linking emissions trading with international markets and expanding it to other industries.

The large proportion of renewable energy and the resulting increase in energy security lend credence to the claim that Renewable Energy Acts are successful at promoting renewable energy and cutting emissions. However, societal acceptance and grid integration remained obstacles. Due to difficulties with implementation, monitoring, and enforcement, national climate change policies were found to be only moderately successful. However, there may be ways to boost its efficacy through collaboration with foreign partners and the transfer of technology.

The research concludes that a mix of policies and regulations designed to address the unique circumstances and difficulties of each country has the potential to reduce global warming gases. The results also emphasize the value of policy evaluation and tracking for informing future decisions.

**Analysis Of Strategies for Promoting Renewable Energy**

The research compared the approaches taken by nations to increase the use of renewable energy. However, there were drawbacks to feed-in tariffs, such as high prices for consumers and limited capacity, despite their effectiveness in promoting renewable energy. However, advancements in technology and application in new fields present possibilities for boosting its efficiency.

While renewable energy targets were found to be very helpful in spreading the word about renewable energy and cutting down on emissions, they did encounter obstacles like a reliance on public funding and regulatory ambiguity. Opportunities to increase its efficacy may arise from public-private partnerships and diversification of financing sources. Grid integration and excess energy curtailment were identified as challenges for solar and wind energy goals despite their effectiveness in supporting renewable energy. Opportunities to increase its effectiveness may arise as technology advances and it becomes more integrated with other industries.

When compared to other renewable energy promotion strategies, biofuels were found to be only moderately successful due to barriers like land use competition and high costs. However, chances to increase its effectiveness may arise from the use of advanced biofuels and waste-to-energy conversion. Due to its limited availability and expensive transaction costs, green financing was found to be only moderately successful in promoting renewable energy. Potential for improvement exists through standardization and public-private collaborations.

Based on the data, it appears that a multi-pronged approach that takes into account the unique characteristics of each country may be the most effective way to advance the use of green energy. The results also emphasize the significance of assessing the efficacy of methods to guide future decision-making.
Comparison of Approaches Across Different Countries:

The research looked at how five different nations are working to curb carbon pollution and boost renewable power. Countries 1 and 4 had the highest carbon prices, while countries 3 and 5 had the lowest. Countries 1 and 2 had aggressive objectives for renewable energy, while countries 4 and 5 had more moderate goals. Countries 2 and 3 had relatively high feed-in tariffs, while countries 1, 4, and 5 had relatively cheap ones. Country 4 had the highest levels of emissions trading, followed by Countries 1 and 5, with Countries 2 and 3 having the lowest levels. Countries 1 and 2 had relatively significant levels of green financing, while countries 3 and 5 had very little.

The findings indicate that various countries take very different approaches to lowering their GHG emissions and increasing their use of renewable energy. The method taken could be affected by variables like political will, general awareness, economic climate, and the availability of natural resources. Nonetheless, the research stresses the significance of assessing the efficacy of various approaches and tailoring them to the unique context and challenges of each country.

This study's results lend credence to the idea that a variety of policies and strategies aimed at lowering GHG pollution and increasing the use of renewable power sources can achieve these ends. In countries where carbon pricing has been implemented extensively, it has proven to be very successful at encouraging businesses to cut their emissions. In nations with a favorable regulatory environment and financial incentives for renewable energy development, renewable energy targets were also found to be very successful. Jobs and local economic growth can be created and supported by feed-in tariffs, which have been identified as an effective method for incentivizing the deployment of renewable energy systems, especially for smaller-scale projects.

Figure 1. Solar Panel Installation on Community’s House Hold

It was determined that emissions trading is only moderately effective because a robust regulatory framework and efficient monitoring and enforcement methods are essential to its success. It was also determined that green financing was only moderately effective, as it is difficult to entice private investment in renewable energy initiatives, especially in countries with little experience in green finance.

Figure 2. Solar Panel Installation on Community’s House Hold (2)
The political will, public awareness, economic conditions, and availability of natural resources all play a role in shaping how various countries handle the problem. The research did show, however, that there is room for international cooperation and education to help find solutions to problems that affect multiple nations.

Figure 3. Solar panel Installation Process

Overall, the study emphasizes the significance of public administration in fostering environmental sustainability and offers insights for policymakers, academics, and practitioners to use in formulating efficient and locally relevant strategies. The results indicate that a mix of policies and methods, adapted to each country's circumstances, can be successful in lowering GHG emissions and increasing renewable energy use. In order to guide future decision-making and encourage continuous improvement, the research also highlights the significance of monitoring and evaluating the efficacy of policies and strategies.

The findings of this research, as stated by Goh and Chong (2023), offer valuable insights into methods for decreasing GHG emissions and increasing the use of renewable energy. The results indicate that multiple policies and strategies are needed to successfully meet the challenges posed by climate change. (Schwartz et al., 2019). As a powerful economic incentive for businesses, carbon pricing is one of the most effective policy tools for lowering emissions. (Zhou & Chen, 2021). Nonetheless, its utility may be constrained in some settings, such as nations with lax regulatory enforcement or sectors with high costs of switching to low-carbon technologies. (Pruccoli et al., 2021).

Targets for increased use of green energy are another useful policy tool, especially when combined with incentives and regulation. (Lu et al., 2020). Findings from this research suggest that targets can be effective in promoting the development and implementation of renewable energy technologies in countries with lofty goals in this area (Wodarczyk et al., 2021).

Investment in dispersed renewable energy systems can be encouraged with the help of policies like feed-in tariffs and net metering. (Ko et al., 2019). Households, businesses, and communities that do not have access to grid electricity can benefit greatly from these mechanisms because they ensure a price for renewable energy produced by small-scale producers. Overcompensating producers and increasing energy prices for consumers are two unintended consequences that may result from using such mechanisms.

Comparing methods across countries showed vast differences in the policies and approaches taken, which can be attributed to the distinctive political, economic, and social environments in each country. The need for country and regional-specific policymaking and international collaboration to benefit from one another’s experiences is highlighted.
Policymakers can learn from one another’s successes and failures by looking at what other countries are doing right and wrong.

The study’s findings, taken as a whole, indicate that a mix of policies and approaches is needed to successfully meet the challenges posed by climate change. Policy and strategy development, as well as their implementation, evaluation, and refinement through public administration, all play crucial roles in ensuring the best possible outcomes. The findings of this study have important implications for lawmakers, researchers, and practitioners working to reduce greenhouse gas emissions and increase the use of renewable energy sources.

CONCLUSION

In conclusion, the results of this study stress the significance of tackling climate change with efficient policies and strategies that lessen emissions of greenhouse gases and boost the use of renewable energy. While carbon pricing and emissions trading systems were found to be effective tools for incentivizing emission reductions, their utility may be constrained in certain settings, as was discovered in an analysis of policies and laws aimed at lowering GHG output. Investment and deployment of renewable energy technologies can be prompted by goals for increased use of such sources, as well as by financial incentives and regulatory support.

The analysis of renewable energy promotion strategies highlighted the significance of tailoring policy to local conditions and of learning from and sharing with other nations and areas. There may be unintended effects of feed-in tariffs and net metering’s success in encouraging investment in distributed renewable energy systems. Significant differences in policies and tactics were revealed by the international comparisons, but so were similarities and shared experiences that can help shape future policymaking.

Overall, the findings of this research highlight the importance of public administration in devising efficient strategies and policies to combat climate change. Governments and public groups must take strong and immediate action to reduce emissions and boost renewable energy as climate change impacts worsen. Policymakers, researchers, and practitioners can use this study’s results to inform the development and implementation of effective strategies to curb emissions of greenhouse gases and advance the use of sustainable energy. To ensure a sustainable future for future generations, we need to continue developing and refining these strategies, and more research is required to do so.
